

Academic Integrity & Anti-Cheating Policy

This project must be completed independently. Academic honesty is mandatory.

1. Prohibited Actions

- Copying code from ChatGPT or other AI tools
- Copying code from classmates
- Using GitHub or online FTP client implementations
- Sharing a part (or full) of your source code with others
- Submitting AI-generated code

2. Permitted Actions

- Reading RFC documentation
- Studying how FTP protocol works
- Discussing high-level design ideas (without sharing code)
- Asking conceptual questions

3. Detection Methods

Submissions will be checked using:

- Code similarity analysis
- Structural comparison
- Behavioral testing
- Mandatory oral defense

4. Penalties

Confirmed plagiarism or AI-generated submissions will receive 0/100.

Students **unable to explain their code during oral defense** will receive 0/100.

5. Integrity Declaration (Required in README)

I confirm that this submission is my own work. I did not copy code from AI tools, classmates, or online repositories.

6. Oral Defense (Mandatory)

Each student must attend a **live code defense if TA Hùng asks**

You may be asked some parts of your program and you must be able to answer them clearly to show your understanding. For example:

- Explain how FTP control and data connections differ
- Modify your code live (small change)
- Add a minor feature live (example: print server reply codes)
- ...

If you cannot explain your own implementation, you will receive 0 point.
